Summary of newborn risk indicators

Generated: 2026-08-22 12:07 Myanmar Standard Time

APGAR Score Breakdown

7 / 10 Normal (7-10) APGAR Score: 7/10 (Normal (7-10)) - Baby is in good health. (A:1 P:2 G:1 A:2 R:1)				
Appearance 1 / 2 Pink body, blue hands/feet Mild concern - body color looks good, but fingertips and toes are still slightly blue.	Pulse 2 / 2 Strong (100+ bpm) Excellent - heart is beating at a healthy, strong rate.	Grimace 1 / 2 Grimace only Moderate - some reflex activity, but response is weak.	Activity 2 / 2 Active movement Excellent - baby is actively moving with good muscle strength.	Respiration 1 / 2 Weak or irregular Concerning - breathing is present but too weak or inconsistent.

Birth Summary

Gestational Age 35.5 weeks	Birth Weight 2.2 kg (2200g)	Mother's Age 37 years
Child's Gender Female	Delivery Method Cesarean Section	Delivery Complication Yes

Immediate Condition Risk

63.1 OF 100	Immediate Risk Index: 63.1 / 100 Risk Level: Moderate APGAR is the main signal. A reported complication raises concern most strongly when APGAR is already concerning.
-----------------------------------	--

Birth-Related Risk

69.0 OF 100	Birth Risk Risk Index: 69.0 / 100 Risk Level: Moderate This module uses gestational age, birth weight, maternal age, and delivery information with overlapping fuzzy memberships.
-----------------------------------	---

Family-History Risk

41.7 OF 100	Family Risk Risk Index: 41.7 / 100 Risk Level: Moderate A disease was reported in another family member, creating a smaller family-history concern.
-----------------------------------	---

Family-History Details

Disease	Who has it	Indicator
Congenital deafness	Other family member	41.7 / 100

Overall Assessment Result

66.7

OF 100

Hierarchical fuzzy result from immediate, birth-related, and family-history modules

Risk Index: **66.7 / 100** Risk Level: **Moderate** Confidence: **Moderate**

Arrange or continue follow-up with a healthcare professional and pay closer attention to the highlighted factors.

Confidence Basis

- All important inputs were complete and valid.
- Family-history information was either specified or no condition was reported.
- The final fuzzy levels showed a usable but not strong separation.

Assessment Factors

Main Contributing Factors	Lower-Impact Factors
1. Low birth weight Birth-weight membership is strongest in the low set.	Stable APGAR pattern The APGAR memberships lean toward the stable range.
2. Advanced maternal age Maternal-age membership is strongest in the advanced set.	Known family disease A disease was reported in another family member, creating a smaller family-history concern.
3. Reported delivery complication A delivery complication was reported separately from delivery type.	Preterm gestational age Gestational-age membership is strongest in the preterm set.

Important Triggered Fuzzy Rules

Activation strength is shown on a 0 to 1 scale. It is not a contribution percentage.

Rule	Name and description	Result	Activation
BR-08 Birth-Related	Complication with a birth concern A reported delivery complication combines with gestational age, weight, or maternal-age concerns.	High	1.00 / 1.00
IM-03 Immediate Condition	Stable APGAR with complication A reported delivery complication can elevate immediate risk even when APGAR is stable.	Moderate	1.00 / 1.00
BR-11 Birth-Related	Low birth weight Low birth weight activates moderate birth-related risk.	Moderate	1.00 / 1.00
BR-14 Birth-Related	Advanced maternal age Advanced maternal age activates moderate birth-related risk.	Moderate	1.00 / 1.00
BR-15 Birth-Related	Reported delivery complication A reported delivery complication activates moderate birth-related risk.	Moderate	1.00 / 1.00
HR-04 Overall Hierarchy	Moderate family-history risk Moderate family-history risk keeps the overall result at least moderate.	Moderate	1.00 / 1.00
BR-06 Birth-Related	Preterm with low birth weight Preterm gestation together with low birth weight elevates birth-related risk.	High	0.80 / 1.00
BR-09 Birth-Related	Preterm gestation Preterm gestational age activates moderate birth-related risk.	Moderate	0.80 / 1.00
HR-02 Overall Hierarchy	Moderate immediate risk Moderate immediate risk keeps the overall result at least moderate.	Moderate	0.79 / 1.00
HR-06 Overall Hierarchy	High birth-related risk persists High birth-related risk remains elevated even when family-history risk is low.	High	0.76 / 1.00

Overall Risk Index Chart

How to read: The dashed curve shows the combined fuzzy-rule result. The vertical line marks the calculated Risk Index.
